

NFL DFS Pipeline — Weekly Runbook

Everything below runs from ~/Projects/nfl-dfs-pipeline. Open Terminal, run cd ~/Projects/nfl-dfs-pipeline once, then use the commands as written. Nothing here logs into DraftKings or submits an entry — you always upload the finished file yourself.

1 · CAPTURE THE SLATE — before lock, every week

Download the projections CSV from Daily Fantasy Fuel or FantasyPros to ~/Downloads first. Then capture salaries, betting odds, and projections in one command:

```
uv run dfs-snapshot --slate-api --odds \
  --projections ~/Downloads/DFF_NFL_cheatsheet_2026-09-13.csv
```

Read the match report it prints. A rate near 100% is healthy. Any **WARNING** naming a player above \$5,000 with no projection means a name failed to match — fix or accept it knowingly before optimizing. Add --dry-run to validate a file without writing anything. Capture whatever week you can: point-in-time odds and projections cannot be bought back later.

2 · BUILD LINEUPS

```
uv run dfs-optimize --slate-api \
  --projections ~/Downloads/DFF_NFL_cheatsheet_2026-09-13.csv \
  --lineups 20 --stack 2 --bringback 1 --max-exposure 0.4
```

The last line prints a run directory such as runs/2026-09-13T18-04-22Z-optimize/. Inside it, lineups.csv is already in DraftKings' bulk-upload format — go to the contest, choose *Import Lineups*, and upload that file. The same directory holds the match report, the post-solve validation report, and the SHA-256 of every input, so any lineup can be traced back to the exact data that produced it.

Useful flags: --stack N pairs the QB with N teammates · --bringback N adds N opponents from that same game · --max-exposure 0.4 caps any player at 40% of lineups · --lock "Name" forces a player in · --ban "Name" keeps one out. Drop --stack and --bringback for cash games.

3 · SCORE THE WEEK — Tuesday, after the games settle

```
uv run dfs-snapshot --results --season 2026 --week 1
```

Pulls final stats from nflverse and scores them at DraftKings Classic rules. nflverse posts on a delay — if a week comes back empty, wait a day and re-run.

WHEN SOMETHING GOES WRONG

exit code 3	Your data was rejected, not the tool. The message names the file, row, and column. Usually a vendor renamed a header.
DST: 0 in the pool	The projections file has no defenses. Download the DST file too, or the optimizer cannot fill the DST slot.
already captured	You are re-running a capture that already landed. Re-run with --on-duplicate ignore to skip the duplicates.
refusing to spend	Odds credits are below the safety floor. Check with --quota (free). The free tier resets monthly; 2 credits per capture.
produced 11 of 20	Constraints are too tight for the pool. The message names which one. Loosen --max-exposure or lower --stack.
cannot reach DraftKings	The endpoint is an unofficial one and can change. Fall back to a manual download: --salaries ~/Downloads/DKSALARIES.csv
exit code 1	Environment, not data. Usually a missing ODDS_API_KEY in .env, or the store path in dfs.toml pointing somewhere gone.

WHERE THINGS LIVE · HANDY EXTRAS

data/snapshots.sqlite	Every observation ever captured. Append-only — nothing is overwritten.
runs/	One self-contained directory per run, written even when a run fails.
dfs.toml	Your standing defaults. Command-line flags always win.
.env	ODDS_API_KEY lives here. Never committed.
--show-config	Prints the settings actually in effect and where each one came from.
--quota	Remaining Odds API credits. Costs nothing.
-v	Add to any command for verbose progress output.
